## Lab 1: Measurements

### Theory:

Measurements are at the heart of all science. In your daily life, measurements are often taken quickly and casually. In scientific experiments we must measure and record the values carefully.

The following units are used in this lab:

$$10 \text{ mm} = 1 \text{ cm}$$

$$1000 \text{ mm}^3 = 1 \text{ cm}^3$$

$$1 \text{ cm}^3 = 1 \text{ mL}$$

The following symbols and equations are used in this lab:

$$d = \textit{diameter}$$

$$h = \textit{height}$$

$$\ell = \textit{length}$$

$$m = \textit{mass}$$

$$r = \textit{radius}$$

$$V = \textit{volume}$$

$$w = \textit{width}$$

$$D = \textit{density}$$

$$V = \ell wh$$

$$V = \pi r^2 h$$

$$V = \frac{4}{3} \pi r^3$$

$$r = \frac{1}{2} d$$

$$D = \frac{m}{V}$$

for a rectangular box

for a cylinder

for a sphere

### Equipment:

Welch measurement set, digital micrometer and calipers, graduated cylinder, top loading mass balance (on back counters)

**Procedure:**

**Part 1: Raw Data**

Measure the following dimensions and record the raw data in the lab report. These numbers are **raw data**. If the instrument is graduated in cm, the raw data must be recorded in cm.

All numbers must have units.

1. dimensions (length, width and height) of the metal rectangular block

$$l = \underline{\hspace{10cm}}$$

$$w = \underline{\hspace{10cm}}$$

$$h = \underline{\hspace{10cm}}$$

2. diameter of the metal sphere

$$d = \underline{\hspace{10cm}}$$

- 3a. diameter and height of the exterior of the metal cylinder (the one with the cavity)

$$d = \underline{\hspace{10cm}} \qquad h = \underline{\hspace{10cm}}$$

- 3b. diameter and height of the interior cavity of the same metal cylinder

$$d = \underline{\hspace{10cm}} \qquad h = \underline{\hspace{10cm}}$$

4. thickness of a sheet of paper using the micrometer

$$t = \underline{\hspace{10cm}}$$

5. mass of the metal rectangular block (from digital mass balance)

$$m = \underline{\hspace{10cm}}$$

6. volume of large metal cylinder measured by fluid displacement

$$V_1 \text{ (water only)} = \underline{\hspace{10cm}}$$

$$V_2 \text{ (water and metal)} = \underline{\hspace{10cm}}$$

## Part 2: *Derived Data*

Compute the following data and record your answers in the lab report.

1. Volume of the metal rectangular block

in units of  $\text{mm}^3$

$$V = \underline{\hspace{10cm}}$$

in units of  $\text{cm}^3$

$$V = \underline{\hspace{10cm}}$$

2. Volume of the metal sphere.

$$V = \underline{\hspace{10cm}}$$

in units of  $\text{cm}^3$

$$V = \underline{\hspace{10cm}}$$

3. Volume of the **outside** of the metal cylinder (in units of  $\text{mm}^3$ )

$$V = \underline{\hspace{10cm}}$$

Volume of the **inside** of the metal cylinder (in units of  $\text{mm}^3$ )

$$V = \underline{\hspace{10cm}}$$

Volume of metal of the cylinder (outside volume – inside volume)

$$V = \underline{\hspace{10cm}}$$

4. Compute the thickness of a stack of 100 sheets of this paper, in cm.

$$t = \underline{\hspace{10cm}}$$

5. Density (mass/volume) of the metal rectangular block (use your value from step 1 and the mass from the raw data step 5). Give your answer in units of  $\text{g/cm}^3$ .

$$D = \underline{\hspace{10cm}}$$

6. Determine the volume of the metal cylinder by subtracting your measurements from step 6 (raw data). Convert units to  $\text{mm}^3$ , then compare your result to the volume you computed in step 3 (derived data).

$$V = \underline{\hspace{10cm}}$$

If this volume is not similar to the answer in step 3, determine why and fix your answers.
